November 1979

PPX POTPOURRI

1. Attention new members - PPX continues to offer the Sourcebook for Programmable Calculators at a sale price of \$9.95 (compared to \$12.95) through the end of January. The sourcebook contains programs written on a college level that cover a wide range of disciplines from Biomedical Engineering to Music Theory. To order a copy, enter "Sourcebook" on your PPX-59 order form and include your check or money order (only) for \$9.95, plus \$1.00 postage and handling, and applicable sales tax. Order now as this offer ends January 31, 1980. This offer is good only in the U.S., Canada, and Mexico.

2. Return to sender — after the mailing of the July 1979 catalog we found that many members did not receive their addendum. The reason, most often than not, was they had a change of address which was never forwarded to us. Although newsletters are mailed first class and can be forwarded, addendums to the catalog are mailed 3rd class bulk rate, and are therefore returned to PPX stamped "return to sender." As mail cost continue to rise, PPX is making every effort to refrain from passing these costs on to you. But, we need your help... we need your new address as soon as you relocate.

For your convenience, starting with this issue, a Change of Address Notice will be included in each future issue of the PPX Exchange. Please return the completed form to us as soon as a new address is known.

3. TI-59 Specialty Pakettes - Pakettes continue to provide software for specific disciplines not covered by a TI-59 Solid State Module. Each Pakette contains 5 to 11 programs within, and is closely related to a specific subject area. Each pakette contains programs written by PPX-59 users who defined their own specific program needs and filled these needs by writing programs. At a \$10 retail price these pakettes are a true software value. (If purchased separately these programs would cost up to \$33). Pakettes do not contain pre-recorded or blank magnetic cards. The PPX-59 Software Catalog (Pages 6-1 and 6-2) lists the program included in each of the following pakettes. Order by writing the pakette name and catalog number on a PPX-59 order form. Enclose \$10 for each pakette plus your state's applicable sales tax, and \$1.00 to cover postage and handling.

Fool-Proofing Multiple Program Systems Donald R. Lambert

Editor's Note: A programming system is a program whose documentation exceeds the general format of PPX-59. The reason that the program documentation is larger than the general format is that the number of program steps usually exceed the 960 steps available on the TI-59 calculator. Programming Systems that have more than 960 steps can be run on a TI-59 by segmenting and running each segment separately. Registers are used to retain the data that is needed between each segment.

Programming Systems often get to be quite large. To keep the size of the system within limits, sometimes a group of similar programs are combined into one system and another group of programs are combined into another (e.g. instead of having one 14-program system, two 7-program systems are written). Such multiple programming systems can pose handling problems to the user. This article addresses two of the most common problems faced when using multiple programming systems and describes how to "fool-proof" against these problems.

Let's try a simple experiment. With the Master Library module in the TI-59, perform the following keystroke sequence: 2nd Pgm, 15, 2nd, OP 09, 2nd, Pgm, 7, 2nd, OP 09. This sequence downloaded program ML-7 on top of ML-15, creating the same effect as when the user of a system accidentally loads cards from the wrong program of the system. In this case ML-7 is still usable, but ML-15 is rendered worse than useless, in that even though it seems to work, it is not doing what we expect it to do!

In using multiple program systems, there is a very real chance that the user might (a) accidentally load cards from more than one program into the calculator or (b) that an attempt would be made to either load a data card before previous data had been recorded, or to load a data card produced by a system not in the calculator (each system has its own data cards).

• The first problem, that of mixed program cards, can be fool-proofed as shown in the following example (in which banks one through three are used to store the program 1. Partition to 3 OP 17 (to obtain banks one through three).

2. Reserve a group of labels that are otherwise unused in any of the programs. These labels will be used as tools in fool-proofing the system. Merged labels can be chosen for this purpose as they are inconvenient for normal use. We will use RC* and ST* as our "fool-proofers." (LBL ST* can be entered by pressing Lbl, SST, BST, STO, IND. RC* can be entered similarly). Each program in the system is to have either different labels or labels used in a different order. (N labels are enough to handle N²-N programs, where N is at least 2).

3. Select a user defined label to trigger the program checking sequence and place this label in the last bank used to store program steps (consider label A for this example). Next, store the following step sequence in bank 3:

481	11	
482	43	
483		
	29	
485		
	71	
	72	STE
488		
491		
492		
100		

The number 1 after the CP step is defined here as the "program number". Each program in the system will be assigned a different program number (1, 2, etc.). RCL 99 (in the above sequence) will cause a flashing display and location 000 will contain a RTN instruction.

4. Store the following steps in memory banks one and two:

Ban	k O	ne	Bank
000 001 002 003 004	9218313	RST LBL RC+	240 241 242 243 244

If the calculator has been correctly loaded, the program will branch from bank three to bank two to bank one, where it will fail to transfer to step 000, and will thus continue to run. If the program number is incorrect between banks one and three, (due to mixed program cards) the program will branch to location 000 in bank one which will cause the calculator to display bank one's program number. RCL 99 will cause the display to flash because the partition doesn't allow 99 registers to be displayed. For maximum speed, all labels should be as near the start of their bank as possible.

• The second problem in fool-proofing multiple program systems concerns improper data card handling. Just as the program cards were purposely given program-to-program incompatibility, each system's data cards must be made incompatible with those of every other system. This can be done as follows:

1. Place an integer and fraction in the form of SS. PP (where SS is the integer system identifier and PP is the fraction program identifier) into register 00. Each program can be easily written to tack its own unique decimal fraction onto the number stored in register 00 just before data is recorded. (hint: use the integer key and t-register when

writing these steps). This will solve both the problem of foreign data cards, and the attempt to prematurely load another data card.

2. Write the program so that it will do two things: (a) Load all data under program control; and (b) test register 00 (against the t-register) for the presence of any decimal fraction, (which indicates that the calculator contains recorded data). If there is no fraction the calculator should stop. If a fraction is detected the calculator should ready itself to read a data card. The decimal fraction on the newly loaded data card is then tested against the program's decimal fraction, and the program either removes the decimal fraction and runs, or stops, as appropriate.

By keeping these simple fool-proofing methods in mind, multiple program systems can be written which include user protection against mixed program cards and improper

handling of data cards.

PROFESSIONAL TRAINING ON THE TI-59

What is the most efficient way for a professional to learn to use the TI-59? The answer to this question for professionals in large and small corporations has been to use Texas Instruments Professional Productivity Program (TIPPP) seminars. TIPPP has been training professionals for over two years through both user and instructor courses on the TI-59.

The user's course objective is to train up to 50 students per class on the calculator so that they may put it to immediate use. This class includes two 8 hour days of hands-on study covering all features and functions of the TI-59. It is also designed to answer questions about applications and to cover a wide variety of software already written in professional areas (PPX programs and pakettes are used as examples for applications of the TI-59).

The second approach is to train up to 10 students per class to become programmable calculator instructors. This "Instructor's Course" takes a full week of continuous instruction, participation and programming. The ability to not only write but to document a complex program is among the objectives here. This is done by using PPX submission forms as a standard for documentation. These lessons enable the students to start up TI-59 program

libraries within their own companies.

In addition to formal classes, TIPPP also can provide a training package comprised of the materials used by TI instructors. These materials enable a user to cover, at his own pace, the same information taught in the users course. The training package includes three video tapes, one hundred and sixty 35mm slides, an instructor's guide and TI-59 workbooks (available for purchase in quantities needed to conduct a training program). This package offers an excellent tool for use within a company's learning center.

The following suggested retail prices pertain to training programs and materials:

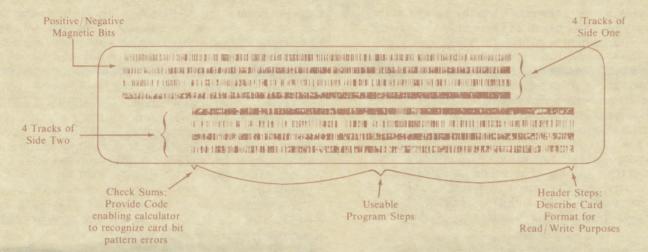

User Course \$1200
Instructor Course \$2400
Self-pace training materials \$650

For more information on TIPPP please write or call:

TIPPP, Texas Instruments Inc. ATTN: John Cable P. O. Box 10508, MS 5873 Lubbock, Texas 79408 (806) 741-3442

TI-59 MAGNETIC CARD

(actual reproduction)

A LITTLE 'BIT' ABOUT YOUR MAGNETIC CARD

As you know, the TI-59 is different from most programmable calculators in that it provides a means of permanent program and data storage. Did you ever wonder what your TI-59 sees when reading a card? Using a four-track magnetic read head it sees (senses) magnetic bits or blips which were earlier placed on the card in a specific pattern. By controlling whether these bits are positive or negative, data can be represented. This method of data representation is based on the "binary" numbering system.

Although we use the decimal (or base 10 system) on a daily basis, we should recognize that other based systems do exist. There is for example base 8, octal; base 16, hexadecimal; and base 2, or binary, which is used by the TI-59

card reader/writer.

The number 17 (17 in base 10) can be expressed as: $1 \times 10^1 + 7 \times 10^0$.

But, the number 17 in base 2 (or binary) is 10001, which can be expressed as:

 $1 \times 2^4 + 0 \times 2^3 + 0 \times 2^2 + 0 \times 2^1 + 1 \times 2^0$

Since there are only two numerals in this system (0 and 1), every digit can be used to reflect the status of a switch (on or off). Each digit of a binary number is called a bit (binary digit). The presence of a positive or negative bit on a magnetic card represents data (see the figure above). The calculator is able to translate data back and forth from key code to binary. Thus by reading or writing a specific pattern of bits on a card, your TI-59 is able to save both the program and data.

PPX-59 PROGRAMMING CORNER

This column is devoted to PPX-59 programming suggestions. If you have a program(s) that you would like to see made available through PPX-59, send your suggestions to PPX. In this way, members who enjoy programming are made aware of your programming needs. PPX-59 is not staffed to do custom programming; therefore, member suggested programs will become available only if another member of PPX-59 comes to the rescue.

Our members would like to see:

 A program that would generate a hemoglobin dissociation curve given the saturation and partial pressure of oxygen (for both venous and arterial blood).

- Civil Engineering program that would determine the influence lines of beams with a variable number of spans, variable moment of inertia, and loaded with uniform and concentrated loads or concentrated moving loads.
- Practical machine shop programs for generation of geometric shapes (e.g., circle) on milling machines, lathes and shapers (where numeric control machines are not available).
- A program that would perform the design calculations for screws with special threads according to federal standard H28-section 3.

Our mistake! — In September, our PPX-59 Programming Corner requested that a program be written to give lagged cross correlations between x(t) and y(t) for lags of +/-6 or more. PPX member, Gerald Fiester, has informed us that his program, "Lagged Regression for Time Series," (PPX #208032D), would perform exactly as the one requested.

MEMORY FLASHCARD

A challenging memory game that allows the player to test his ability to recall in sequence up to 10 rapidly flashing numbers (up to 10 digits in length). Program uses the master library.

PPX wishes to thank David E. Powers, for his excellent program.

User Instructions:

- 1. Enter Program
- 2. Enter seed (0-199017), press E'.
- 3. Enter number of flashes (1-10), press A
- 4. Enter maximum number of digits (1-10), press B
- 5. Press C to begin flash sequence.
- 6. Enter guess for sequence, pressing R/S after each number.
- 7. Press E to display score for round.*
- 8. Press A' to display mean score, or press 1 to guess again (repeat step 6), or press C to review sequence.
- 9. Press B' to determine cumulative score.
- 10. Press C' to determine mean score.
- *See note under example problem.

Example:

Enter	Press	Display	Comments
2541	E'	0	Enter seed
3	A	3	Select number of flashes
3	В	3	Select max. digits per flash
	C	85	Sequence flashed
		456	
		516	
		0	
85	R/S	85	1st number in sequence
456	R/S	456	2nd number in sequence
516	R/S	516	3rd number in sequence
			All correct
	E	9	Score *

Note: The score is based upon the total number of flashes multiplied times the number of digits. One point is deducted for each incorrect digit guessed. Based on this ground rule, when the display flashed '85', it was recognized as a '085' for scoring purposes (i.e. 3 digits).

001 13 C 025 14 D 049 00 00 073 14 14 067 43 RCL 121 59 1NT 145 32 NT 169 72 8T# 193 58 (217 15 00 22 43 RCL 026 92 RTM 1050 56 55 074 43 RCL 098 12 12 122 42 8T0 146 01 1 170 14 14 194 48 RCL 218 11 003 25 25 027 42 8T0 051 86 8TF 075 27 27 099 55 # 123 00 00 147 01 1 171 01 1 195 30 30 219 05 00 42 8T0 028 27 27 052 01 01 076 61 070 100 53 (124 42 8T0 148 32 NT 172 44 8UM 196 55 - 260 36 P 005 00 00 029 43 RCL 059 01 1 077 00 09 101 48 RCL 218 25 25 25 149 77 0E 173 14 14 197 43 RCL 221 15 006 01 1 030 28 25 054 44 8UM 078 45 45 102 26 26 126 32 NT 150 02 02 174 97 087 198 31 31 222 12 007 05 5 031 42 8T0 055 29 289 079 43 RCL 103 75 - 137 00 11 125 25 175 00 00 199 54 223 25 00 00 42 8T0 025 00 00 00 056 7 082 030 28 8 RCL 103 75 - 137 00 1 151 25 25 175 00 00 199 54 223 25 00 00 42 8T0 025 29 28 079 43 RCL 103 75 - 137 00 1 151 25 25 175 00 00 199 54 223 25 00 00 42 8T0 032 00 00 056 7 082 030 28 38 104 05 1 185 34 071 153 36 01 10 200 42 8T0 024 35 00 00 00 14 14 033 01 1 057 00 00 00 00 056 7 082 030 00 00 00 056 17 082 030 00 00 00 00 00 00 00 00 00 00 00 00	RIN RIN REL REL REL REL

THE ADDITION OF FRACTIONS

Adding and subtracting fractions can cause anybody trouble (most often parents checking their children's homework). For those who are having this problem and want something done about it, PPX comes to your aid with — "The Addition of Fractions." This program allows the user to add or subtract any two fractions and receive the answer in the lowest terms. All operations performed with this program are additions. Therefore, to do subtraction, enter +/- for the appropriate numerator. The negative sign always has to be entered with the numerator. If a PC-100A/C is attached, the outputs will be printed and labeled.

PPX wishes to thank the author of "The Addition of Fractions," Ron Jorgensen, for his excellent program.

User Instructions:

- 1. Enter Program
- Clear memories and t-register by pressing CLR, CMs x ≥ t
- 3. Enter the first fraction using the following two steps:
 Enter numerator, press A.
 Enter denominator, press B.

Note: Display flashes when a zero denominator is

- 4. Enter the second fraction by first entering the numerator and then the denominator and pressing C and D, respectively.
- 5. The answer's numerator will be displayed after step 4 (above) is completed. Obtain the final denominator by pressing E.

Example:	2/3-	4/3 - 1	Answer: -2/15
Enter	Press	Display	Comments
	CLR	0	
	CMs		Clear memories and
			t-register.
	$x \neq t$		The previous value of
			the t-register will be
			displayed.
2	A	2.	Numerator #1
3	В	3.	Denominator #1
4+/-	C	-4.	Numerator #2
5	D	5.	Denominator #2
		-2.	Final Numerator
	F	15	Final Denominator

PROGRAMMING POINT OF VIEW-REVISTED

A short "TI-59 evaluator test," written by Maurice Swinnen and his programming group, appeared in the March 1979 issue of PPX Exchange. The test was based on the premise that individuals solve programming problems differently depending upon their profession and programming experience. To discover the readers' programming point of view the reader was asked to solve the following problem, and then turn to a page inside the March newsletter to determine his 'programming' point of view.

The display contains either a 1 or a 2. Write a program that leaves a 1 in the display if the previous content was a 2, and vice-versa.

Since then Maurice Swinnen received the following additional "solutions" from readers:

From professional computer analyst:

	76	LBL
001		
002		
003	73	00 RC#
004		
006		RIN
2.		01
1.		02

An OP 10 nut came up with this one:

and finally, a statistician took the cake with this one:

001	11	H
	47	
	29	
004		2+
		2+
		RC+
	02	-02
009	-10	E.
		RIM

FROM THE ANALYST'S DESK

• PPX member John F. Szablya of Pullman, Washington, has passed along a procedure that is helpful when editing transfer addresses.

This procedure may be confusing (and dangerous) to beginning programmers because it is a "shortcut." It uses a method that is not explained in the Personal Programming Manual. It is not our purpose to explain why it works but to provide a method for editing that could save the user some trouble.

By closely adhering to the procedure below, a minimum number of keystrokes will have to be pressed when editing:

1. Find the keystroke whose code would correct the address (refer to the key code table on page V-50 of Your Personal Programming Manual). If the code is not found in the table, you must resort to the normal method of editing.

2. Go to the location in programming memory at which the correction needs to take place.

3. Press the keystroke.

For example, consider the case when the address of the instruction, if flg 2 346, has to be changed to if flg 2 365. Normal procedure would be to press LRN followed by pressing all six keys involved to initiate the change (i.e. if flg 2 365). But note that only one location had to be changed. The location that contained code 46 was changed to 65. This change could have been done by referring to page V-50 in Personal Programming, finding the keystroke of code 65 to be x (multiplication sign), and pressing x at the location which contained the 46.

• Two program sequences which differ only by an INV instruction at the beginning of one of the sequences can be split using a label. This idea, which saves duplicate program steps, was sent to PPX by Don Phillip of Eugene, Oregon.

For example, press LRN and enter the following key-

strokes:

000 76 LBL 001 11 A 002 22 INV 003 76 LBL 004 12 B 005 23 LNX 006 91 R/S

Enter 5, press A, the display will contain the antilogarithm of the natural log (i.e., 148.4131591). If you enter 5 and press B, the display will contain the natural logarithm of 5 (i.e., 1.609437912).

However, the INV condition will not hold during a label search. Therefore, if INV is pressed from the keyboard before pressing a user defined key, the INV will be ignored. Try entering 5 and pressing INV then B. You will note that execution ignores the INV instruction. Likewise, if your routine looks like this:

The search for label D will cause the INV instruction to be

• PPX has received several questions about keying in T1-59 programs from PC-100A tape listings. In general, the user should key in what is indicated on the tape. See page V1-6 of your Personal Programming manual for a complete list of PC-100A tape instructions and their equivalent key strokes. The following are exceptions to the rule:

The instructions Fix, st flg, if flg, and Dsz should be keyed in with a single digit number (0-9) which is stored in one program location. When printed, a 'silent' zero is present in the PC-100A listing. For example, if Fix 2 is keyed into the TI-59 (with printer) the printed output will include a 'silent' zero which was not keyed in.

000 58 FIX 001 02 **02**

The absolute address following the instructions x = t, $x \ge t$, GTO, SBR, and Dsz n (where n is the register) occupies two program locations. As an absolute address can be up to 3 digits long, the hundreds digit goes into the first location and the tens and ones digits share the second location. For example, pressing GTO 058 results in the following printout:

000 61 GTO 001 00 00 002 58 58

The PPX Exc hange is published every other month and is the only newsletter published by Texas Instruments for TI-59 owners. You are invited to submit items you feel are of general interest to other TI-59 users. Inputs should be limited to 3 double-spaced typed pages. Please forward your newsletter inputs and any questions to:
